Original Article

Abstract

INTRODUCTION: The learning organization model does not exist in the RCS of Tehran province based on knowledge management, innovative organizational culture and quality of work life as an important organization, during disasters, especially the Tehran earthquake. Therefore, the aim of the current study is to present the learning organization model in RCS of Tehran province.

METHODS: This applied research was carried out with grounded theory approach. About 15 academic professors and experts of RCS of Tehran province were selected and studied using purposeful sampling method based on the theoretical saturation. Data were collected through semi-structured interviews.

FINDINGS: In this research, the learning organization with five dimensions and 56 concepts were extracted. The dimensions of the learning organization include gaining experience, feedback and evaluation system, systemic thinking, collaborative and fast learning, creative thinking.

CONCLUSION: According to the results, focusing on gaining experience with regard to the occurrence of disasters is one of the priorities of the RCS. The challenges that the RCS faces at the learning organization are such as repeating the problems of previous disasters in new disasters, failure to use documentation and experiences of previous disasters, early forgetfulness of disasters and long return period of some disasters, failure to transfer field and operational experiences, not learning from the bitter experiences of disasters, infringing and sometimes copying processes without considering operational experiences, lack of expert documentary maker or teams in disasters and finally many disasters and little documentation. RCS can take action to manage these defects by implementing the learning organization model.

Keywords: Learning organization; Red Crescent Society; Gaining experience; System thinking.

Introduction

learning organization is an organization that takes over and manages all the intellectual power, knowledge and experience of the organization to create change and continuous improvement for development and has the ability to create, acquire and transfer knowledge. In the systematic definition, it is an organization that learns powerfully and collectively and constantly changes itself so that it can collect and use information in a better way. (1)

In fact it calls an organization that has the skill

and ability to create and transfer knowledge and modify people's behavior to apply new knowledge and insight. (2)

Alvani et al (2016) has stated that a learning organization learns, changes and transforms its performance over time and is capable of changing behaviors, if an organization seeks progress, it must align itself with new needs and environmental changes, in keeping up with environmental changes; change its structure so that it can at least meet its new needs due to the changes. (3)

²⁻ Associate Professor, Faculty of Education Sciences, Islamic Azad University, Roudehen Branch, Roudehen, Iran

The learning organization shows the concept of organizational change approach and continuous improvement and determines the capacity of change. In today's era, the ability and extent to which organizations can learn and react faster than their competitors emerges as a competitive advantage. (4)

IRCS is part of an international humanitarian relief movement, which has found a unique strategic position due to its role as a government-designated organization in disaster relief. The unpredictability of the time of occurrence, the complexity of a range of hazards, rapid demographic, socio-economic and climatic changes and its harmful effects on the one hand and the need of the constructive and effective role of the RCS in conjunction with the Sendai International Framework for Disaster Risk Reduction by 2030 on the other hand has increased the efficiency and effectiveness of the functional processes of the RCS.

From a strategic view, the realization of this transformation depends on the RCS transition from the current situation to a dynamic learning organization. The opportunities and obstacles for the RCS to transition to a learning organization were calculated for further investigation in a structural-mission content analysis based on the ten-year organizational strategy and statutes and reexamining of the lessons learned from its roles in the most prominent national and international missions. (5)

In this study due to the lack of a learning organization model, the researcher seeks to present a learning organization model in the RCS of Tehran.

Methods

In the present study, data was collected step by step by referring to the research literature based on the contents of exploratory interviews. The interview questions were designed and specified in advance as an open answer so that the answers fit into the pre-designed categories. Then, the opinions expert and managers were examined.

Due to the need to comply with health

protocols, the interviews were conducted virtually and in some cases face-to-face by complying with the protocol. The interviews continued until theoretical saturation, and then the interviews were implemented and reviewed several times. In the present research, test-retest reliability and intra-subject agreement method were used to calculate the reliability of the interviews.

In order to calculate the retest reliability, 3 interviews were selected among the conducted ones, each of which was coded twice in a 30-day interval by the researcher (Table 1).

Table 1. Calculation of retest reliability

Title of the interview	Total number of codes	Number of agreements	Number of disagreements	Test- retest reliability (%)
S2	64	23	18	72
S4	79	34	11	86
S10	57	25	7	88
Total	200	82	36	82

Table 1 shows that the total number of codes in two time intervals of 15 days is equal to 200, the total number of agreements between codes in these two times is equal to 82, and the total number of non-agreements in these two times is equal to 36. The retest reliability of the interviews conducted in this research using the mentioned formula is equal to 82%. Considering that this reliability rate is more than 60%, the reliability of coding is confirmed.

Inter-coder reliability

In order to calculate the reliability of the interviews with the within-subject agreement method of two coders (evaluators), a PhD student was asked to participate in the research as a colleague (coder); afterwards, the necessary training and techniques for coding the interviews were presented to him, then the number of three interviews was coded and the percentage of agreement within the subject, which is used as a reliability index of the analysis, was calculated using the following formula:

Intra-subject agreement =
$$\frac{\text{Number of agreements} \times 2}{\text{Total number of codes}}$$
 %100

Table 2. Calculation of reliability between two coders

Title of the interview	Total number of codes	No. of agreements	No. of disagreements	Inter-coder reliability (percentage)
S1	86	37	12	86
S7	67	27	13	81
S13	71	30	11	84
Total	224	94	36	84

Table 3. Interview questions

Questions What are the constituent elements of a learning organization from your point of view? What is your definition of a learning organization in the RCS? How can the constituent factors of the learning organization affect the employees of the RCS from your point of view? What do you know about the inhibiting and facilitating factors of the learning organization in the RCS?

What are your suggested strategies for implementing a learning organization in the RCS?

Learning organization

descriptions	
Using experiences to overcome challenges	In organizations where the knowledge management system has been implemented, we will witness the creativity and agility of employees in facing issues and challenges.
Assessing the talent of employees continuously	Prepare a list of employees who are interested in learning and creative regularly (for example, every six months).
Evaluation and identification of employee talents	An information bank of talents of employees and volunteers should be established and their knowledge and talents should be used for organizational productivity when necessary.
Learning through teamwork and transfer of experience	In the RCS, knowledge and experience in carrying out activities is transferred informally and based on the attendance records of employees in operations.
Competency assessment, the context of creating new patterns	If worthy employees and volunteers are identified and introduced, it can be expected that new patterns will emerge in the organization.
Evaluating the effectiveness of employee training	The learning process of the employees is aligned with the objectives of the RCS after the analysis of the outputs, rewards or salaries and benefits are paid.
Evaluating the competence of employees	To achieve a learning organization, merit selection and meritocracy will be calculated under the organizational culture and will be presented as a leader in the crisis management process.
Feedback based on process transparency	If the criteria and coefficients of the vertical and horizontal promotion charts are clear, the employees will also try to reach them.
Organizational atmosphere to improve the level of learning	Employees consider themselves as members of the organization's family, so that they can step in sync with the goal of personal growth and advancing organizational goals.
Effective communication for the development of knowledge and experience	If the components of the organization update themselves continuously and regularly in relation to each other, we can expect the growth of experience and knowledge
Taking advantage of experiences	It is natural that if the methods learned from the implementation of ideas are documented, successful and failed ideas will be encouraged with various mechanisms and experiences will be transferred in full transparency.
Collaborative learning	The learning organizations in the RCS will facilitate the fields of learning by using various scientific and experimental capacities in the volunteers.
Using previous knowledge and experiences	Collecting and studying the history of RCS activities in the past years can prevent mistakes from happening again.
Technical and critical look at operations to improve organizational knowledge	Reviewing, evaluating and publishing the results of the operations will improve the level of knowledge of employees, members and volunteers.
Collaborative management to enhance learning	Definitely, applying collaborative management skills will be a turning point in the learning of the entire organization.
Scientific meritocracy based on knowledge	Paying attention to the value of human resources by focusing on scientific and experimental competence creates motivation for learning in the population personnel
Systemic view to the learning organization	Investing in the scientific and experimental improvement of employees reduces the costs caused by crises.
Creativity, knowledge management & teamwork	The learning organization in RCS is known for its creativity, knowledge management and working group in crises.
Crisis management using the learning organization	Considering the simultaneous realization of the knowledge life cycle (production and collection, distribution, analysis, storage and application of knowledge), the learning organization can take advantage of opportunities and eliminate crises.

Feedback &	Compilation of employee evaluation indicators	Determining appropriate evaluation indicators in the learning process/using indicators for evaluating past accidents/ the necessity of continuous evaluation of indicators	
evaluation system	Periodic & continuous evaluation	Evaluation and identification of employee talents/evaluation of competences in the context of creating new patterns /evaluating the growth and development of employees according to the structure of training/examining and evaluating teamwork problems in the organization/assessing the talent of employees on a continuous basis/ employee competency assessment/evaluating the effectiveness of employee training	
Systematic	Strategic foresight	Drawing a vision and carrying out targeted activities/system planning for employee promotion/ formulating targeted plans to realize the learning organization/organized planning to improve the level of motivation/mapping the future to improve employee motivation	
thinking	System approach	Institutionalizing the need to learn/learning based on transparency in job description/improving the effectiveness level in interaction of systems/ systemic approach to the learning organization/implementation of powerful leadership in line with employee empowerment/scientific meritocracy based on knowledge	
Collaborative and	Participation in learning	collaborative management to enhance learning/employee participation in achieving the organization's goals/group learning/accelerating cooperative learning/participation in the management process to improve level of motivation	
fast learning	Group learning	Group learning to obtain international standards/replacing the culture of collectivism against individualism/ learning according to organizational culture/learning for organizational excellence/ changing the structure to align with globalization/ learning through teamwork and transfer of experience/existence of common ideals as motivation for learning	
Creative Thinking	Strengthen thinking in affairs and creativity	Enhancing creativity to draw the future/institutionalizing thinking in innovation and creativity/ creating an open space in presenting creative and new ideas/creativity, knowledge management and teamwork/ updating processes based on technological progress/institutionalizing innovation in specialized matters/ attention to details to achieve big goals	

Findings

According to Table 2, the total number of codes is 224, the total number of agreements between these codes is 94, and the total number of disagreements between these codes is 26. Reliability between coders for interviews conducted using the mentioned formula is equal to 84%. Considering that this reliability rate is more than 60%, the reliability of the coding is confirmed and can be claimed that it is appropriate. By reviewing the data collected from the research text (theoretical basis) and in-depth interviews, the researcher identified and named their hidden concepts at this stage.

First stage: basic themes

In this stage, the collected materials were written in a table in two stages and suitable titles were chosen for each of them. The first stage was done by the researcher himself and the second stage was done by one of the expert and opinionated people, then the common titles were fixed and the different titles were modified; in this stage 56 primary codes were extracted. (Table 4)

Second stage: organizing themes

At this stage, the researcher compared the primary codes and did the task of categorizing and receiving the components by discovering the relationship between the common areas. In this step, 11 core codes (components) were identified in the form of 56 items. (Table 5)

Third stage: overarching themes

In this stage, the researcher focused on the strength of the concepts and components, considering the previous stages, and in a more general category, the common features of the outstanding components from the previous stages were identified and organized in a more general and limited category due to the commonalities. In this step, 56 items were categorized in 5 dimensions in the form of 11 components.

Discussion and Conclusion

In this research, the learning organization was introduced with five dimensions after examining the interviews of the experts and specialists in the form of 56 basic themes (indices) such as: experience gathering, feedback and evaluation system, systemic thinking, collaborative and fast learning, creative thinking.

Due to the occurrence of accidents and disasters, the focus of gaining experience is one of the priorities of the RCS. There are challenges

that the RCS faces at the level of the learning organization. which can be solved by implementing the learning organization model including repeating the problems of previous disasters and accidents in new ones, failure to use documentation and experiences of previous disasters, premature forgetting of disasters and the long return period of some disasters, failure to transfer field and operational experiences and not learning from the bitter experiences of disasters, infringing and sometimes copying processes without considering operational experiences, lack of expert documentary makers or documentation teams in disasters and accidents, occurrence of many disasters and little documentation.

At the structural and organizational level, the challenges that must be considered for the successful implementation of knowledge management in the disaster risk management structure are such as: the idea of temporary management, absence or lack of specialized knowledge about the assigned management task, the governance of a work culture that demands quick results, the governance of the culture of fostering and admiring showcase work, ignoring the future in aid and operational organizations. precedence of political, party and group interests over organizational interests, employees' lack of familiarity with documentation, lack of specific and practical standards and software for recording information, unfamiliarity with effective methods of documenting experiences, lack of relatively accurate criteria for valuation and choosing valuable experiences, not asking operational managers, hiding experiences from newly arrived managers, lack of documentation guidelines especially in the operations department.

In the following, these items should be included in the agenda, including: establishment of the National Organization of Crisis Documents at the macro level for operations or a deputy in the management organization comprehensive documentation of operations (the existence of an information system that is responsible for providing, retrieving, analyzing and using appropriate information to varying degrees in the crisis management department), documenting the experiences of managers and operational forces with qualitative research such autobiography, action research. phenomenology, documentation of organizational creating documents and activities by all documentation unit in operational organizations (using effective data recording software and evaluating data quality regarding data collection and recording, also collecting and managing data and turning it into useful information is the basis of a successful planning in all stages before, during and after the operation), suggesting the implementation of research projects in order to formulate guidelines. checklists and in general all components of gathering documentation of operations from needs assessment to termination, preparation of documentation instructions and conducting documentation courses and taking examples from successful organizations in the field documentation, such as the war education headquarters and also evaluation documentation software and documentation methods based on existing scenarios (6&7).

Among the problems and challenges that must be considered in the lower layers, the following can be listed: the existence of informal organizations to support the manager and as a result not providing clear reports, fear of being reprimanded and creating media scandals due to providing a clear and accurate report, political fringes, lack of critical discourse, lack of communication between the university and operational organizations, lack of evaluation and analysis reference system, emotional discourse and early forgetting of disasters, individual exclusivity of documentation of previous experiences, lack of discourse to analyze and refine experiences, failure to hold post-operation analysis sessions, lack of researchers in the field of operations and communication with operational teams, lack of national and international publication of aid organizations' reports, imitative educational system, innate lack of desire to write, lack of belief in historical review, common sense and having a passive system against disasters (8&9). In order to manage these challenges, it is suggested to identify propulsion and uncertainties in a prospective study and implement scenarios for the successful implementation of learning organizations in organizations related to crisis management. (10&11)

According to the results of the statistical analysis, gaining experience is effective in creating a learning organization in the RCS of Tehran province, and this result is consistent with the research literature and the view of Peter Senge, who mentions it as an effective factor in creating a learning organization.

Acknowledgments

The authors would like to express their gratitude to all the participants in this research.

Conflict of Interests

The authors declare no conflict of interest.
